A construction-use plumb bob structure comprised of a blunt top, pointed bottom conical body having a thread-fastened sharp tip and a cord conjoining component respectively installed at its upper and lower extremities, wherein a recessed cavity formed in the internal section of the body ensconces a filler material of similar shape, the external threads died along its lower extent of a dish-shaped attachment unit are fastened to the internal threads tapped along the upper extent of the recessed cavity, and a threaded section at the bottom end of a narrow gauge cord is fastened into the internal threads in the attachment unit. As such, since a filler material of different composition is ensconced inside the body, the present invention weighs the same as an originally solid plumb bob such that there are no differences during utilization. Furthermore, the invention herein achieves the objective of reducing production cost.

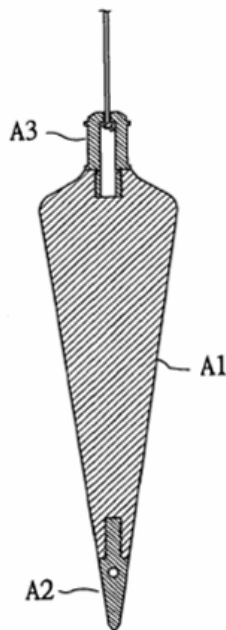

FIG. 1-B
PRIOR ART

He will modify the well known US carrot shape plumb bob full body brass into the new type.

He has got the patent in many countries, not in the U.S.A. only

I am not sure if the gain of material costs is higher than the additional working costs, but we will see. Perhaps in the next years we will see this plumb bob on the market.
